Bella Hadid is the most beautiful woman in the world, according to science

Bella Hadid (or rather, her mathematical beauty) surpasses that of other celebrities such as Beyoncé and Ariana Grande. Yes, the American model of only 23 years has the perfect measurements on the face, which Renaissance masterpiece, according to the plastic surgeon Julian De Silva. Science, in 2009, by Professor Kendra Schmid concluded that there is a numerical formula to explain why some people are considered more beautiful than others. Although some might note that beauty remains subjective, not for science. Let's take action then.

Yes, Bella Hadid is enshrined as the most beautiful woman in the world, surpassing many (many super models). To determine this, science asserts that a perfect face must have a length of one ear equal to the length of the nose, just as the width of an eye is equal to the distance between the eyes. Do you know who has it that way, according to science? Bella Hadid, and not exactly her sister, Gigi Hadid.

The debate before this beauty assertion has begun, and many celebrities left behind Bella, including: Beyoncé, Amber Heard and Ariana Grande. The science of the Golden Ratio or golden number, also known as *Beauty Phi*, is to blame for this statement that, for many out there, could mean great discouragement.
